

SHABAZ KHAN

Senior Software Engineer | Distributed Systems • Cloud Platform • AI Automation

Bangalore, India | +91 8147851973 | tnshabazkhan@gmail.com | linkedin.com/in/shabaz-khan-268306150 | github.com/tnshabazkhan

PROFILE

Backend and cloud-focused Senior Software Development Engineer with 6+ years of experience engineering high-throughput distributed architectures and agentic developer automation workflows. Proven track record in low-latency API design, deep SQL performance optimization, and custom protocol services. Adept at leading technical squads and building intelligent developer-productivity tools that streamline core engineering lifecycles.

TECHNICAL SKILLS

AI Engineering: MCP, Autonomous Agents, Skill Definition, Function Calling, DevProd Automation

Languages: C#, SQL, TypeScript/JavaScript, Go (Golang), C++, Python, Java

Backend & Cloud Infrastructure: Microservices, .NET Core, ASP.NET Core, Distributed Systems Design, Azure (App Service, Service Bus, Application Gateway, WAF, Front Door, Key Vault, Application Insights, Blob Storage), Entity Framework, SQL Performance Tuning, Redis, Docker, Kubernetes, CI/CD Pipelines

Frontend & UI: Angular, ReactJS, ElectronJS, WPF, Microsoft Fluent UI

Engineering Tools & Practices: TDD (Playwright, Vitest, SpecFlow, Jest), HLD/LLD, OpenID/SSO, REST APIs, Agile/Scrum

PROFESSIONAL EXPERIENCE

Software Engineer — WiseTech Global

Bangalore, India | May 2023 – Present

- Architected a suite of custom Model Context Protocol (MCP) servers utilizing standardized JSON-RPC schemas to securely expose live Work Item (WI) details, local environment setups, and technical document extraction hooks to AI development tools.
- Built autonomous agentic skills to accelerate the engineering lifecycle, enabling LLM assistants to parse pull request diff payloads for code reviews, automate boilerplate construction, and draft system design markdown outlines.
- Architected the event-driven HLD/LLD integration between Transit Warehouse and the "Gate" product, completely automating vehicle arrivals via "Gate In" signals and empowering teams to book consignments directly during arrival.
- Engineered real-time safety validation APIs calculating warehouse-specific Dangerous Goods (DG) volume limits, current remaining capacities, and incoming vehicle loads to return automated, low-latency "Allow" or "Reject" safety thresholds.
- Led development of high-risk package screening workflows with multi-stage validation controls for security-critical shipments.
- Optimized high-scale SQL Server transit detail views and index architectures on 7M+ record datasets, accelerating query latency from 155ms to 12ms and slicing storage reads by 40-48% across load-list and receiving workflows.
- Streamlined a high-volume package transfer architecture on 7M records, slashing raw processing latency from 2,252ms to 438ms and eliminating a critical 16.2s per-package compute overhead within asynchronous state logic.
- Migrated heavy client-side workflows to server APIs, dropping browser memory allocation from 1.459 GB to 0.408 GB and cutting mobile scanning API latency from 5.0s to 0.7s to maximize operational throughput.
- Modernized testing infrastructure, migrating Jest to Vitest and SpecFlow to Playwright while strengthening TDD practices.

Software Engineer 3 / Team Lead — HashedIn by Deloitte

Bangalore, India | Oct 2021 – May 2023

- Managed and mentored a dedicated squad of 6 software engineers across user-story mapping, comprehensive technical estimation, continuous sprint delivery, and robust architectural code reviews.
- Architected and delivered three core cloud-native microservices (User/Auth, Financial Escrow, and Documents Management) using .NET 6, Angular 11, SQL Server, and Azure App Service layers.
- Designed a unified custom routing gateway using Ocelot; managed migration to Azure App Gateway to leverage managed Web Application Firewall (WAF) and regional Layer 7 load balancing.
- Integrated Azure Front Door CDN for asset acceleration, Redis cache layers, Key Vault security, and EF-level pagination/search libraries to maximize globally distributed performance and query optimization.

Software Engineer — Betsol Software India Pvt. Ltd.

Bangalore, India | Jul 2019 – Oct 2021

- Engineered cross-platform corporate backup and secure device-to-device migration systems utilizing .NET Core, ElectronJS, ReactJS, and high-performance WebSockets for registry adjustments and large data streaming.
- Built an efficient, automated data sync pipeline between local SQLite engines and Cloud SQL Server as the single source of truth for persistent distributed-state consistency across terminal operations.
- Implemented multithreaded C# Tasks and custom Delegates to delegate intensive system-level file and registry extractions without blocking primary interactive application UI frameworks.

PROJECTS

DocuFlow — AI-Powered Document Analysis System (Personal Project)

Developed a distributed document-processing platform using .NET 10, Azure Functions, Cosmos DB, Service Bus, React Native, Azure AI Document Intelligence, and Azure OpenAI for OCR, classification, summarization, and automated PDF reporting of 1,000+ page documents.

EDUCATION & CERTIFICATIONS

Education: B.E. in Information Science and Engineering — Bangalore Institute of Technology, India (2015 - 2019)

Certifications: Microsoft Certified: Azure Developer Associate • Secure Flag Backend & Frontend - Advanced • 7x HackerRank Certified (Problem Solving, C#, SQL, REST API, ReactJS, Python, JavaScript)
